S NO.	PROGRAM	PAGE NO.	SIGNATURE
1.	WAP to find the factorial of a number using C++.		
2.	WAP to check whether a number is even or odd.		
3.	WAP to find out largest element in an array of 10 elements		
4.	WAP to print table of number entered by the user.		
5.	WAP to check whether a number entered by the user is prime or not.		
6.	WAP to create a class library which contains data as student_id, card_no, book_name, no_of_days, of issued book and fine, functions as- input(), fine(), show() Calculate fine by formula- $\text{Fine} = ((\text{no_of_days} - 6) * 10)$		
7.	WAP to create a class mobile which contains data as mobile_id, company name, mobile no. and price. Functions as input(), show(), and calc() to calculate final price after 10% discount. Store information for 6 mobiles.		
8.	WAP to create a class medical store which contains data as medicine name, price, manufacturing date and expiry date. Functions as input(), calc(), show(). In calc() find out final price after 15% discount on price. Store information for 10 medicines.		
9.	WAP to input name, age, salary of 5 employees and then display all. Use function getdata() to input values and putdata() to display values.		
10.	WAP to perform addition of time in hours and minute format		

INDEX

11.	. WAP to create a class rectangle. Take data members as a and b and member functions as input(), show() and a friend function area() to find out the area.		
12.	WAP to create a class number and another class number1. Class number contains member data as n1, functions as input() and class number1 contains member data as n2 , function as input(). Both classes contains common friend function greatest to find out greatest between n1 and n2.		
13.	WAP to input and display marks of 2 subjects by using constructor.		
14.	WAP to create a class electricity which contains member data as number of units, price per unit, basic charge. Calculate electricity bill using formula- Bill= basic charge + (no. of units x price per unit) Take no of units, price per unit from user using parameterized constructor and take basic charge = 300 as constant in that constructor.		
15.	WAP to create a class marks which contains data members sub1, sub2, sub3, sub4 . Functions as average() to calculate average of 4 subject marks and use the concept of constructor overloading to initialize the data members.		
16.	Write a Program to add two complex no using operator overloading		
17.	Write a Program to overload unary operator using friend function.		
18.	Write a Program to implement template class.		
19.	Write a Program to store and display following records of an employee. a. Data Member: empno, name, basic_sal, da, hra, gross_sal. b. Member Functions: getData() , display().		
20.	Write a Program to show function overloading with different types of arguments
